Summary
This package will install Python 3.7.0 for macOS 10.9 or later.
Python for macOS consists of the Python programming language interpreter, plus a set of programs to allow easy access to it for macOS users including an integrated development environment IDLE.
NEW in 3.7.0: two installer variants (10.9+ 64-bit-only, 10.6+ 64-/32-bit), built-in Tcl/Tk 8.6 support (no additional third-party downloads!), OpenSSL 1.1.0, and more!

Summary
Important Information
This package will install Python 3.7.0 for macOS 10.9 or later for the following architecture(s): x86_64.
Which installer variant should I use?
For Python.3.7, python.org currently provides two installer variants for download: one that installs a 64-bit-only Python capable of running on macOS 10.9 (Mavericks) or later; and one that installs a 64-bit/32-bit Intel Python capable of running on macOS 10.6 (Snow Leopard) or later. (This ReadMe was installed with the 10.9 or later variant.) If you are running on macOS 10.9 or later and if you have no need for compatibility with older systems, use the 10.9 variant. Use the 10.6 variant if you are running on macOS 10.6 through 10.8 or if you want to produce standalone applications that can run on systems from 10.6. The Pythons installed by these installers are built with private copies of some third-party libraries not included with or newer than those in macOS itself. The list of these libraries varies by installer variant and is included at the end of the License.rtf file.
Certificate verification and OpenSSL
This variant of Python 3.7 includes its own private copy of OpenSSL 1.1.0. The deprecated Apple-supplied OpenSSL libraries are no longer

HISTORY AND LICENSE
HISTORY OF THE SOFTWARE
Python was created in the early 1990s by Guido van Rossum at Stichting Mathematisch Centrum (CWI, see http://www.cwi.nl) in the Netherlands as a successor of a language called ABC. Guido remains Python's principal author, although it includes many contributions from others.
In 1995, Guido continued his work on Python at the Corporation for National Research Initiatives (CNRI, see http://www.cnri.reston.va.us) in Reston, Virginia where he released several versions of the software.
In May 2000, Guido and the Python core development team moved to BeOpen.com to form the BeOpen PythonLabs team. In October of the same year, the PythonLabs team moved to Digital Creations (now Zope Corporation, see http://www.zope.com). In 2001, the Python Software Foundation (PSF, see http://www.python.org/psf/) was formed, a non-profit organization created specifically to own Python-related Intellectual Property. Zope Corporation is a sponsoring member of the PSF.
All Python releases are Open Source (see http://www.opensource.org for

Summary
Congratulations! Python 3.7.0 for macOS 10.9 or later was successfully installed.
One more thing: to verify the identity of secure network connections, this Python needs a set of SSL root certificates. You can download and install a current curated set from the Certifi project by double-clicking on the Install Certificates icon in the Finder window. See the ReadMe file for more information.

ReadMe.rtf — Locked

This package will install Python 3.7.0 for macOS 10.9 or later for the following architecture(s): x86_64.

Which installer variant should I use?

For Python.3.7, python.org currently provides two installer variants for download: one that installs a *64-bit-only* Python capable of running on *macOS 10.9 (Mavericks)* or later; and one that installs a *64-bit/32-bit Intel* Python capable of running on *macOS 10.6 (Snow Leopard)* or later. (This ReadMe was installed with the *10.9 or later* variant.) If you are running on macOS 10.9 or later and if you have no need for compatibility with older systems, use the 10.9 variant. Use the 10.6 variant if you are running on macOS 10.6 through 10.8 or if you want to produce standalone applications that can run on systems from 10.6. The Pythons installed by these installers are built with private copies of some third-party libraries not included with or newer than those in macOS itself. The list of these libraries varies by installer variant and is included at the end of the License.rtf file.

Certificate verification and OpenSSL

This variant of Python 3.7 includes its own private copy of OpenSSL 1.1.0. The deprecated Apple-supplied OpenSSL libraries are no longer used. This means that the trust certificates in system and user keychains managed by the *Keychain Access* application and the *security* command line utility are no longer used as defaults by the Python `ssl` module. A sample command script is included in `/Applications/Python 3.7` to install a curated bundle of default root certificates from the third-party `certifi` package (https://pypi.org/project/certifi/). If you choose to use `certifi`, you should consider subscribing to the project's email update service to be notified when the certificate bundle is updated.

The bundled `pip` included with this installer has its own default certificate store for verifying download connections.

Using IDLE or other Tk applications

Both installer variants now come with their own private version of Tcl/Tk 8.6. They no longer use system-supplied or third-party supplied versions of Tcl/Tk as in previous releases.

Other changes

For other changes in this release, see the *What's new* section in the Documentation Set for this release and its *Release Notes* link at https://www.python.org/downloads/.

Python 3 and Python 2 Co-existence

Python.org Python 3.7 and 2.7.x versions can both be installed on your system and will not conflict. Command names for Python 3 contain a 3 in them, `python3` (or `python3.7`), `idle3` (or `idle3.7`), `pip3` (or `pip3.7`), etc. Python 2.7 command names contain a 2 or no digit: `python2` (or `python2.7` or `python`), `idle2` (or `idle2.7` or `idle`), etc.
